

## USER TESTING: SETTING

You are participating in today's usability tests for the new application that is being **developed for OBIS concerning entering small occurrences data.**

The application you are testing is a proof of concept, with **fake data**. Data you are entering **will not be saved**, and sometimes when using features such as an auto-fill field, editing data, copying data, .... the data suggested **will not match the data entered by you.**

Please note that this is normal at this stage. The accuracy of the data is not our focus, the general user experience is.

Please **feel free to think out loud** if you feel comfortable. This will make it easy for the moderator to follow your train of thought.

Be aware that **there are no wrong ways to complete a scenario**. If anything is unclear, that is probably the interface's doing, not yours. We are trying to match users' expectations with our design. How much of it did we get right off the bat, that's what we're trying to determine here 😊

## YOUR ROLE

You are a **marine biologist** who collects data for species in their area of expertise and within their regional occupancy. You have **some written notes that need to be converted to the digital realm** somehow, so that others can consult them on [www.obis.org](http://www.obis.org). Some notes in some scenarios were passed on to you by a colleague in the field, who trusts you better with a computer than he does himself.

A brand new tool is being introduced for making this type of data entry manageable, without having to know any technical details of the behind-the-scenes works. This is the tool you are testing today
